## A Study on the Occupational Ethics for Future Network and Data Utilization In a Social Network Environment

Kim, Su-Won(KRIVET) · Jung, Tae-Wuk(KIVPD)

In order to fundamentally address many unethical problems that may arise in the hyper-networked social environment, It is necessary to prepare a plan to set up and apply the work ethics that will be more important than ever in the world of work prior to enacting related laws, regulations and laws.

In this context, this study aims to establish the direction of related work ethics (plan) so that ethical value can be applied to experts and stakeholders in each field. And in the future, we sought to search for schemes to utilize this as behavioral code, personality evaluation as well as teaching-learning materials in the characterization/meister high school, the college, the vocational training institution, the public institution, and the enterprise.

In order to accomplish the purpose of this study, we examined related theories and systems such as precedent research, domestic and foreign case analysis, and examined issues related to job structure, job content, and work ethics through Delphi survey. Based on the above, the direction, proliferation, and application of the work ethic for future network and data utilization in the hyperlinked social environment are derived, and policy suggestions are suggested based on this.
